Water units are typically reported in cubic feet or 100 cubic feet (ccfs). A cubic foot is 7.48 gallons. 100 cubic feet is 748 gallons.

For this bill you would multiply 10×748 to get the use in gallons: $10 \text{ ccf} \times 748 \text{ gallons} = 7,480 \text{ gallons}$.

Divide 7,480 gallons by 60 to determine the average use per day: $7,480 / 60 = 124.7 \text{ gallons}$.

Divide by the number of people in your home for the average amount of water used per person per day.

For example, if there are 5 people in your home, you would divide $124.7 \text{ gallons} / 5 \text{ people} = 24.9 \text{ gallons per person per day}$.
